# 1.INTRODUCTION

## 1.1 PROJECT OVERVIEW

### “CRIME VISION:ADVANCED CRIME CLASSIFICATION”

Predictive policing is the use of analytical techniques to identify likely places of future crime scenes or past crime perpetrators, by applying statistical predictions [1]. As a crime typically involves a perpetrator and a target and occurs at a certain place and time, techniques of predictive policing need to answer: (a) who will commit a crime, (b) who will be offended, (c) what type of crime, (d) in which location and (e) at what time a new crime will take place. This work does not focus on the victim and the offender, but on the prediction of when and where a certain crime type will occur, using past data. The ultimate goal, in a policing context, is the selection of the top areas in the city for the prioritisation of law enforcement resources per department. One of the most challenging issues of police departments is to have accurate crime forecasts to dynamically deploy patrols and other resources to improve deterring of crime occurrence and police response times. Routine activity theory [2] suggests that most crimes take place when three conditions are met: a motivated offender, a suitable victim and lack of victim protection. The rational choice theory [3], suggests that prospective criminal weighs the gain of successfully committing the crime against the probability of being caught and makes a rational choice whether to actually commit the crime or not. Both theories agree that a crime takes place when a person willing to commit it has an opportunity to do so. As empirical studies in near repeat victimisation [4,5,6,7] have shown, these opportunities are not randomly distributed but follow patterns in both space and time. Traditionally, police officers use maps of an area and place a pin on the map for every reported incident. Studying these maps, they can detect these patterns and, thus, efficiently predict hotspots; the areas with the higher possibility for a crime to occur, compared to the neighbouring areas.

## 1.2 PURPOSE

Criminology literature investigates the relationship between crime and various features, developing approaches for crime forecasting.

The majority of the works focus on the prediction of hotspots, which are areas of varying geographical size with high crime probability. The methods include Spatial and Temporal Analysis of Crime (STAC)[22], Thematic Mapping [42] and Kernel Density Estimation (KDE) [33]. In STAC, the densest concentrations of points on the map are detected and then fit to a standard deviational ellipse for each one. Through the study of the size and the alignment of the ellipses, the analyst can draw conclusions about the nature of the underlying crime clusters [6].

## **2. LITERATURE SURVEY**

Songnian Li et.al.in their paper “Geospatial big data handling theory and methods: A review and research challenges”, mentioned the proposed system, they made review on various geospatial theory and methods used to handle geospatial big data. Given some special attributes. Authors considered that customary data taking controlling methodologies and techniques are lacking and the following domains were recognized as in requirement for further advancement and examination in the control. This incorporates the advancements in calculations to manage real-time analytics and to support ongoing flooding data, as well as improving new spatial indexing techniques. The improvement of theoretical and methodological ways to deal with transfer of big data from illustrative and parallel research and applications to ones that investigates easygoing and illustrative connections.

### **2.1 EXISTING PROBLEM**

The primary research aims to find various efficient algorithms for predicting neighborhood crimes. In our previous work [6], we used statistical analysis to predict the crimes in Newyork city. Our paper got good attention from the researchers, so we wanted to look for the efficient machine learning and deep learning approaches used in

this area. We have followed a systematic approach to select the papers for this review. As part of this research, we have considered the papers from multiple databases related to predicting crime.

## **2.2 REFERENCES**

Nowadays automatic visual surveillance is the main need for security and this paper presents the first step in the direction of automatic visual weapon detection. The objective of our paper is to develop a framework for visual weapon detection for surveillance. By using the K-mean clustering algorithm the proposed framework exploits the color-based segmentation to eliminate unrelated objects from an image. Speeded up robust features (SURF) interest point detector is used to locate the weapon. Our framework is robust enough in terms of scale, rotation, and occlusion. We have implemented and tested the system over sample images of weapons. Our system performs under different appearances of images.

## **2.3 PROBLEM STATEMENT DEFINITION**

Crimes now a days are increasing day by day and with different level of intensity and versatility. The result is a great loss to society in terms of monetary loss, social loss and further it enhances the level of threat against the smooth livelihood in the society. To overcome this problem, the computing era can help to reduce the crime or even may be helpful in predicting the crime so that sufficient measures can be taken to minimize the loss to property and life. The crime rate prediction strategies can be applied on historical data available in the police records by examining the data at various angles like reason of crime, frequency of similar kind of crimes at specific location with other parameters to prepare the model crime prediction.

### 3. IDEATION AND PROPOSED SOLUTION

The proposed system is made on the basis of the research work that is done by going through various such documentations. Nearly all of the crimes are predicting based on the location and the types of crimes that are occurring in those areas. On surveying previous works, Linear Regression, Decision Tree and Random Forest tend to give good accuracy so these models are used in this paper to predict crimes. The dataset used in this paper is from data.world.com. The data set contains different types of crimes that being committed in India according to the state and year respectively.

#### 3.1 EMTATHY MAP CANVAS

Template

### Empathy map canvas

Use this framework to empathize with a customer, user, or any person who is affected by a team's work. Document and discuss your observations and note your assumptions to gain more empathy for the people you serve.

Originally created by Dave Gray at 

[Share template feedback](#)

**Says**  
What have we heard them say?  
What can we imagine them saying?

categorize and solve crimes more efficiently.

prevent and understand criminal patterns.

justice and closure for our loved ones.

create a powerful and reliable crime classification system.

**Does**  
What behavior have we observed?  
What can we imagine them doing?

Supports community policing efforts

stays informed about local crime trends

Shares case details with law enforcement

collaborates with law enforcement agencies.

**Pain**

Struggle with a backlog of unsolved cases

challenges of manually classifying crimes

High-pressure environment to maintain public safety.

**Crime Vision:  
Advanced Crime  
Classification With  
Deep Learning**

**Thinks**  
What are their wants, needs, hopes, and dreams  
What other thoughts might influence their behavior?

Rising complexity of criminal activities

Technology can help us solve cases faster

advancement of technology could help bring justice

potential impact of work on crime prevention and resolution.

**Feels**  
What are their fears, frustrations, and anxieties?  
What other feelings might influence their behavior?

Anxious about rising crime rates

Concerned about personal safety

Experiencing pain, trauma, and a strong desire for justice.

pressure to maintain public safety.

**Gain**

Improved efficiency and quicker case resolutions.

Enhanced crime prediction capabilities.

Greater trust from the public through effective crime classification.

## 3.2 IDEATION & BRAIN STORMING

### 1 Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

5 minutes

---

#### PROBLEM STATEMENT

This problem stems from the increasing demand for improved public safety and law enforcement capabilities in identifying and responding to criminal activities. The existing methods for crime classification often rely on manual labor and are prone to errors, which hinders timely intervention.

**Key rules of brainstorming**  
To set a smooth and productive session

- Stay on topic.
- Quantity over quality.
- Defer judgment.
- One idea at a time.
- Encourage wild ideas.
- Listen to others.
- Be generous.
- Build on others' ideas.
- It's possible, for now.

### 2 Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

**TIP** You can replace a sticky note with 10 for group ideas or 100 for individual ideas.

**Sampath Kumar**

- Automated Surveillance Systems
- Crime Hotspot Prediction
- Social Media Threat Detection

**Azim**

- Preventive Policing
- Behavioral Analysis in Schools
- Public Awareness Campaigns

**Jaaswan**

- Automated Evidence Collection
- Voice Recognition for Emergency Calls
- Advanced Facial Recognition

**Saisha**

- Traffic Violation Detection
- Security at Mass Gatherings
- Domestic Violence Detection

### 3 Group Ideas

Take some sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

20 minutes

**TIP** Add a sentence-like label to each cluster to make it easier to discuss, organize, and present your ideas.

Conduct educational campaigns to inform the public about crimes.

Analyze the body language of individuals during interactions with law enforcement.

evidence collection at crime scenes to ensure accuracy and completeness.

Report domestic violence incidents security at large events and gatherings to prevent criminal activities.

Develop a user-friendly dashboard for law enforcement to monitor and analyze crime data in real time.

Upgrading the locks on your doors, windows, sheds and outbuildings

Create a mobile app for law enforcement to access real-time crime data and reports while in the field.

Using secure passwords to prevent criminals hacking your online accounts

Fitting smash jammers to vulnerable doors and windows

crime hotspots based on historical data and other influencing factors.

identify potentially threatening behavior in schools and report it to authorities.

monitor public transportation for criminal activities, such as pickpocketing and harassment.

evidence collection and processing.

Develop a comprehensive biometric database for law enforcement to identify criminals quickly.

monitor and prevent shoplifting in retail stores.

provide mental health support and crisis intervention.

allow police officers to communicate with and collect information from communities they serve.

### 4 Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

20 minutes

**TIP** Participants can use their own ideas to add and remove ideas to the grid. The facilitator can also add ideas to the grid using the same process (adding the ideas to the grid).

### 3.3 PROPOSED SOLUTION

## Writing a Proposal to Solve a Problem (LO 12.2)

4

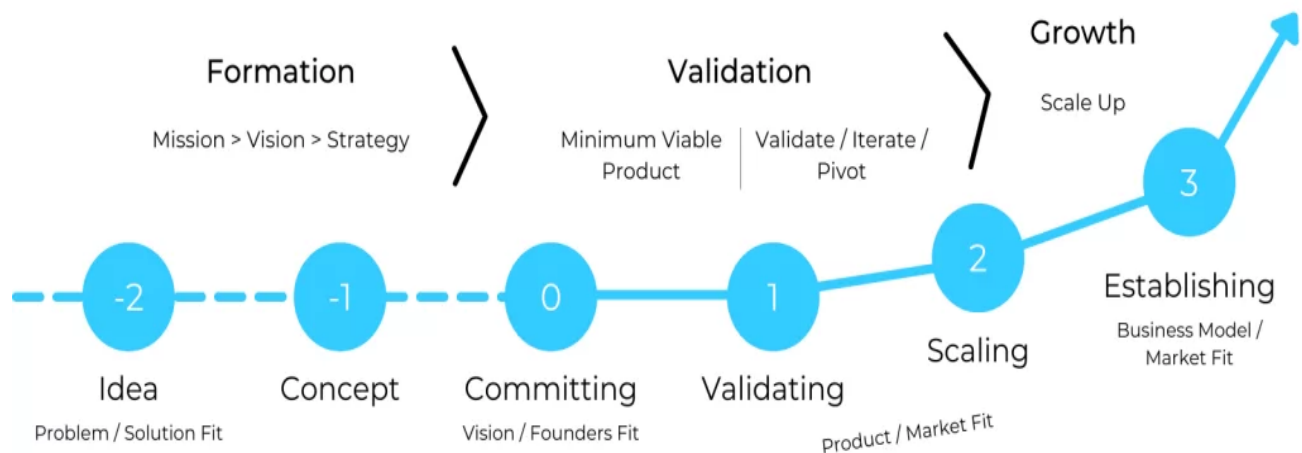

- Identify a problem and demonstrate that it exists.
- Appeal to your audience.
- State your claim.
- Propose a solution to the problem.
- Organize your solution(s) effectively.
- Persuade your audience that your solution is feasible and worthwhile.
- End with a call to action.

Read. Think. Research. Persuade. Communicate.

© 2012 by The McGraw-Hill Companies, Inc. All rights reserved.

### 3.4 PROMBLEM SOLUTION FIT

#### Different stages of startups

## 4. REQUIREMENT ANALYSIS

1.Data Collection

2.Data Pre processing

3.Training and Testing

4.Modiling

5.Predicting

### 4.1 FUNCTIONAL REQUIREMENT

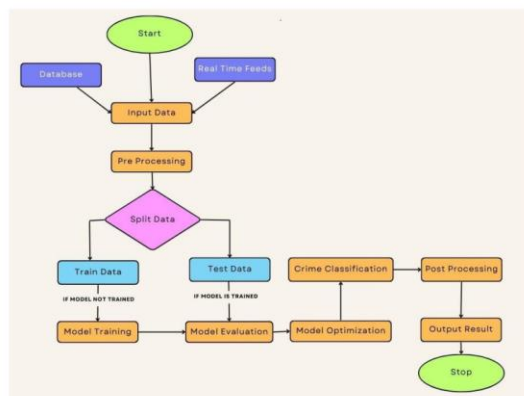

A functional requirement is a statement of how a system must behave. It defines what the system should do in order to meet the user's needs or expectations. Functional requirements can be thought of as features that the user detects.

### 4.2 NON-FUNCTIONAL REQUIREMENT

Packing slips shall be printed on both sides of 4"x 6" white paper, the standard size for packing slips used by local printers.

## 5.PROJECT DESGIN

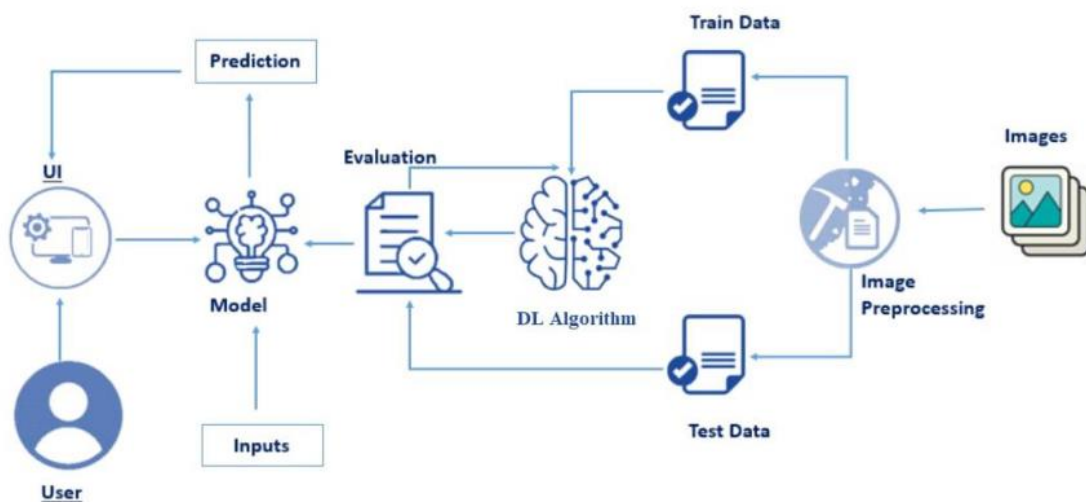

### 5.1 Data Flow Diagrams & User Stories

A process of outlining all of a project's stages and creating a project plan . It includes strategizing, developing ideas, gathering resources and creating processes to achieve goals and keep within a budget and deadline.

## 5.2 Solution Architecture

The proposed solution architecture for an AI crime classification system using deep learning follows a supervised learning approach, where a deep neural network is trained to predict the type of crime based on diverse features such as location, time, and crime characteristics. This architecture comprises several key stages. It initiates with the collection and preprocessing of crime data from various sources, followed by the crucial step of data labeling, associating each entry with its respective crime type. Feature extraction is then employed to derive relevant input attributes for the neural network, allowing it to discern patterns and relationships in the data. The heart of the system lies in the deep learning model, which is trained on the labeled dataset. Subsequently, rigorous evaluation ensures the model's accuracy and effectiveness, leading to its deployment within law enforcement agencies for real-time or batch crime classification tasks. Importantly, a feedback loop is integrated to continually improve the model's performance, adapt to evolving crime patterns, and accommodate new data sources or features. This scalable and modular architecture empowers law enforcement to enhance the precision and efficiency of crime classification, ultimately contributing to more effective crime resolution and safer communities

## 6. PROJECT PLANNING & SCHEDULING

### 6.1 Technical Architecture

S.No	Component	Description	Technology
1.	UI (User Interface)	The system incorporates visual and interactive components that enable users to engage with and manipulate its features.	HTML, CSS, JavaScript, UI frameworks (e.g., React, Angular)
2.	Model	The computational framework or model that acquires knowledge from data and generates forecasts.	Deep learning frameworks (e.g., TensorFlow, PyTorch), programming languages (e.g., Python), neural network architectures (e.g., CNN, RNN)
3.	Deep Learning Algorithm	The particular algorithm or method employed in the deep learning model to discern patterns and make forecasts.	Convolutional Neural Networks (CNN), Recurrent Neural Networks (RNN), YOLO (You Only Look Once), etc.
4.	Evaluation	Evaluating the model's performance and its effectiveness in action.	Metrics (e.g., accuracy, precision, recall, F1score), programming languages (e.g., Python), data analysis libraries (e.g., NumPy, pandas)
5.	Image Pre-processing	The input images undergo various operations to improve their quality and make them more suitable for analysis..	Image processing libraries (e.g., OpenCV), programming languages (e.g., Python), image manipulation techniques (e.g., resizing, normalization)
6.	Train Data	The data with assigned labels utilized for training the deep learning model.	Labelled image datasets, data collection and labelling tools

7.	Test Data	The labeled dataset employed to assess the effectiveness of the trained model..	Labelled image datasets, data collection and labelling tools
----	-----------	---	--

### 6.2 Sprint Planning & Estimation

### 6.3 Sprint Delivery Schedule

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Team Member
Police officer	Crime Classification using Deep Learning	USN-1	I want to upload crime-related images to the system for classification.	-The system should provide an option to upload an image file. -The system should accept common image formats such as JPEG or PNG. - Upon uploading, the system should process the image for crime classification.	High	Saisha
		USN-2	I want the system to accurately classify the type of crime based on the uploaded image.	-The system should analyze the image using deep learning techniques to identify the type of crime present. - The classification should be based on predefined crime categories such as assault, burglary, robbery, etc. -The system should provide a confidence score or probability for the classification result.	High	Sampath

		USN-3	I want to view the classification result along with additional information about the crime.	-The system should display the classified crime category prominently. -The system should provide relevant details or metadata about the crime, such as location, date, and time. -The system should present any additional insights or recommendations based on the classification result.	Medium	Azim
		USN-4	I want to track and analyze crime classification results over time.	-The system should maintain a log or history of classified crimes. -The system should allow filtering and searching of classified crimes based on various criteria such as date, location, or crime type. -The system should provide statistical or graphical representations of crime trends and patterns.	Medium	Jaaswand
User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Team Member
Prosecutors	Crime Classification using Deep Learning	USN-5	As a Prosecutor, I want it for assisting in research case law and legal precedents to build stronger legal arguments.	-The system must achieve a minimum level of accuracy and precision in crime classification, evidence analysis, and suspect identification. -The system should perform well on a diverse range of criminal cases, considering different types of crimes, locations, and evidence types. -The system must demonstrate effective measures to mitigate biases related to race, gender, age, or other factors. It should undergo bias testing, and bias levels should be within acceptable limits.	Low	Sampath

## 10.ADVANTAGES & DIS-ADVANTAGES

### Advantages

As such crime has no advantages in perspective of society but for the in perspective of criminal the advantages are

- Criminal may get recognition in the society, though it will be bad recognition.
- Criminal may possess physical goods through burglary

## **Disadvantages**

- The criminal has to face various punishments set by the law department.
- The person will get hatred from the society.
- He may feel remorseful after doing that and may get trouble sleeping.

## **11.CONCLUSION :**

It is clear that basic details of criminal activities in a neighborhood contain indicators that will be employed by machine learning agents to classify a criminal activity given a location and date. The training agent suffers from imbalanced categories of the dataset, it had been ready to overcome the problem by oversampling and under-sampling the dataset. This paper presents a crime data prediction by taking the types of crimes as input and giving are in which these crimes are committed as output using Jupyter notebook having python as a core language and python provide inbuilt libraries such as Pandas and Numpy through which the work will be completed faster and Scikit provides all the processes of how to use different libraries providing by the python.

## **12.FUTURE SCOPE**

From the encouraging results, we believe that crime data mining has a promising future for increasing the effectiveness and efficiency of criminal and intelligence analysis. Visual and intuitive criminal and intelligence investigation techniques can be developed for crime pattern. As we have applied clustering technique of data mining for crime analysis we can also perform other techniques of data mining such as classification.
